

Understanding the ETF creation and redemption mechanism

The creation and redemption mechanism underpins the inner workings of an exchange-traded fund (ETF). Many of the potential benefits of an ETF are enabled by the creation and redemption process. While this process is executed daily in the ETF industry, confusion often arises due to the complexity associated with how and why creations and redemptions occur.

As with a traditional mutual fund, the number of shares of an ETF in circulation can change on any trading day as a result of the product's open-ended structure—meaning shares can be added or subtracted to balance demand in the market. This mechanism—referred to as “creation and redemption”—allows the share price of an ETF to be only momentarily tethered to supply and demand while staying grounded in the value of the assets held by the fund over the longer term. The creation and redemption process occurs between ETF issuers and large institutional investors known as “Authorized Participants,” or APs.

Creation and redemption mechanism

ETFs have a unique creation and redemption mechanism. APs create or redeem shares of an ETF directly to or from the fund in creation units (large blocks of at least 25,000 ETF shares), which are generally exchanged in-kind for baskets of the underlying securities and/or cash. APs act as market makers on the open market, using their ability to exchange creation units with their underlying securities to provide liquidity of the ETF shares and help ensure that their intraday price approximates the net asset value (NAV) of the fund.

Creation

To create additional shares of an ETF, an AP will generally purchase all the securities that constitute the ETF in appropriate proportion to the overall portfolio and will then exchange this “basket” of securities with the ETF issuer in exchange for one or more creation units of the ETF.

Under certain circumstances, an AP may provide cash in lieu of some or all of the basket securities, along with a transaction fee to offset the cost to the ETF of acquiring the securities.

Redemption

To redeem shares of an ETF, an AP will accumulate a sufficient number of shares of the ETF to constitute a creation unit and will then exchange these ETF shares with the ETF issuer for a basket of securities of equivalent value.

If an AP receives cash in lieu of securities, it will typically pay a transaction fee to offset the cost to the ETF of liquidating the securities from the ETF's portfolio.

Why do creations and redemptions occur?

There are two primary reasons why creations and redemptions are essential for the everyday efficiency of an ETF. First, because APs do most of the buying and selling of the securities held by the ETF, the trading costs and fees are removed from the fund, allowing tighter tracking to its underlying index. Second, because an ETF is like a stock, its share price will fluctuate throughout the trading day due to supply and demand. APs monitor this demand and buy or sell the underlying shares. In turn, the ETF's share price is kept at fair value while the AP benefits from an arbitrage profit.

Large trade orders

When interest in an ETF is high, either because of many smaller orders or because one client wishes to acquire or divest a position of significant size, an AP may effect a creation or redemption event. The creation/redemption mechanism is an efficient way to execute a large trade order. The AP will generally pay the trading costs and fees, including those to the ETF issuer to cover processing the creation/redemption activity. Since the ETF itself generally doesn't pay for these transaction costs, the fund may have tighter tracking to its benchmark index performance. In comparison, in a mutual fund, all shareholders bear the cost of the trading expenses due to the buying and selling of the underlying securities held within the portfolio. Due to transaction costs and trading spreads, this may be costly and impact the returns of the mutual fund.

Maintaining fair value through arbitrage

Arbitrage is a profit opportunity that helps ensure an ETF's share price in the secondary market remains tightly correlated to the value of the securities held in the ETF portfolio. To the extent that an ETF's share price strays from the fair value of its portfolio securities, APs will "arbitrage" the difference.

If the market price of the ETF is above the its NAV, an AP could purchase the underlying basket of securities and short-sell¹ the ETF. Later the AP will execute a creation event, with the new ETF shares covering the short-sell position. The opposite occurs when the market price of the ETF is below the its NAV. In this case, the AP would buy the ETF and short-sell the underlying basket of securities, and later execute a redemption event to cover the short position in the underlying basket.

Summary

The creation and redemption mechanism is a key component of how an ETF functions. The ability of APs to add or subtract ETF shares from the market to match demand can deliver efficiencies and tighter tracking typically not seen in a traditional mutual fund. Many of the potential benefits of an ETF can be derived as a result of this process. APs play a critical role to ensure the ETF is priced fairly and in line with its NAV. APs may also help to provide tighter tracking within the ETF by absorbing the transaction costs caused by the buying or selling of the underlying securities held within the ETF. This unique process has helped ETFs become one of the fast-growing investment vehicles available to investors in today's modern world.

Key terms

Authorized participants

Large institutions that transact directly with the ETF issuer to create or redeem shares of an ETF.

Creation unit

The minimum number of ETF shares required to transact directly with the ETF issuer. This is typically at least 25,000 shares.

Primary market

The direct exchange of securities for shares of an ETF between authorized participants and ETF issuers.

Secondary market

The national markets system (e.g., the stock exchanges and other venues where listed securities can be traded). Shares of ETFs are continuously bought and sold throughout the day on an exchange or other trading venue by investors.

We're always here to help

ETF Know:How is a full-spectrum curriculum of ETF tools, resources, and insights created for all levels of ETF expertise. This educational program offers you a 360-degree view of ETF investing, with tactical steps to help support your business—from client engagement to portfolio implementation.

To learn more about ETF Know:How and how it can help advance your ETF expertise, call 877-824-5615 or visit schwabfunds.com.

Investment returns will fluctuate and are subject to market volatility, so that an investor's shares, when redeemed or sold, may be worth more or less than their original cost. Unlike mutual funds, shares of ETFs are not individually redeemable directly with the ETF. Shares are bought and sold at market price, which may be higher or lower than the net asset value (NAV).

¹ Short selling is the process of selling a security that either the seller does not own or that the seller has borrowed. Short selling is motivated by the belief that a security's price will decline, at which point the seller can buy it back at a lower price to make a profit.
